

As a computer technician, I highly awaited the advent technology of BPL, however as an Amateur Radio Operator (KD4ZQE) I am definately concerned about problems that may arise from flooding of the HF radio bands with RF interference from BPL services.

As much as I would love access to this service (I live in a rural are where broadband is not available), I must take into consideration the moral implications of essentially destroying HF communication countrywide, if not worldwide. As far as I am concerned, interference from an electrical infrastructure such as the US is basically turning us into the RF Spammers of the globe.

Please consider this decision carefully. I have faith that if this technology is approved, it will be under acceptable restrictions to minimize such interference.

Thank you.
